

COVID-19:

Risk of Contamination of Products, Health and Safety in the Working Environment

Ultrafilter GmbH, as one of the leading filtration manufacturers in the world, would like all users of compressed air to be aware of the following notice.

In view of this exceptional situation, it is our duty as experts in the field of purification of compressed air to help, wherever we can. The Coronavirus SARS-Co V-2 is extremely dangerous, in particular when it has been adsorbed from the atmosphere into the compressed air system for the following reasons.

1. The virus will enjoy warm temperatures, humidity and sufficient food to develop at an increased rate - not in comparison to the atmosphere.
2. The concentration of the Coronavirus in a compressed air system may be significantly higher than in the atmospheric air.
3. Due to the potentially high concentration of the virus in the compressed system it may contaminate the Filter at a much higher rate.

As filtration experts, we would like to make you aware that it is essential to prevent the virus from going into food and into the environment of the workforce, where the compressed air is expanded.

As a precaution we recommend sterilising your sterile elements more frequently.

For all other compressed air filters, we recommend shortening the replacement interval.

For further questions and consultation, Ultrafilter recommends that you speak with one of our filtration experts to ensure your process safety and reduce the risk of spreading the virus.
